Growing to a 100-center program across 36 states, the QOD is always looking for new participants. Contributing practices receive not only data collection tools to measure and improve the quality of care at their own facilities, but also may benefit from participating in the QOD’s knowledge management platform, a portal where staff can access results of QOD quality measures. The QOD is also currently working with the Institute for Healthcare Improvement (IHI) to make its data collection methods right here at the Neurosciences Institute. “The QOD helps us ensure the safety of our patients,” says Dr. Asher, who continues to lead the QOD and established some of its key principles.
